Prolog

MESTRADO INTEGRADO EM ENGENHARIA INFORMÁTICA
Sistemas de Representação de Conhecimento e Raciocínio

- Theory:
 - Unification;
 - Unification in Prolog;
 - Proof search.

- When Prolog unifies:
 - **mulher(X)**
 - with
 - **mulher(ana)**
- It is instantiating the variable **X** with the atom **ana**.

- **Two terms unify:**
 - if they are the same term,
or
 - if they contain variables that can be uniformly instantiated with terms in such a way that the resulting terms are equal.

- This means that:
 - **ana** and **ana** unify;
 - **42** and **42** unify;
 - **mulher(ana)** and **mulher(ana)** unify.
- This also means that:
 - **bruno** and **ana** do not unify;
 - **mulher(ana)** and **mulher(berta)** do not unify.

- What about the terms:
 - **ana** and **X**;
 - **mulher(Z)** and **mulher(ana)**;
 - **gosta(ana,X)** and **gosta(Y,miguel)**
- They unify!
 - **X** is instantiated to **ana**;
 - **Z** is instantiated to **ana**;
 - **X** is instantiated to **Miguel**, **ana** to **Y**.

- When Prolog unifies two terms, it performs all the necessary instantiations, so that the terms are equal afterwards;
- This makes unification a powerful programming mechanism.

- If C_1 and C_2 are constants, then C_1 and C_2 unify if they are the same atom, or the same number;
- If C_1 is a variable and C_2 is any type of term, then C_1 and C_2 unify, and C_1 is instantiated to C_2 (and vice versa);

- If C_1 and C_2 are complex terms then they unify if:
 - They have the same functor and arity, and all their corresponding arguments unify, and the variable instantiations are compatible.

How will Prolog respond?

?- X=ana, X=bruno.

no

?-

Why? After working through the first goal, Prolog has instantiated X with **ana**, so that it cannot unify it with **bruno** anymore. Hence the second goal fails.

Example with complex terms

?- $k(s(g), Y) = k(X, t(k)).$

$X = s(g)$

$Y = t(k)$

yes

?-

- Prolog does not use a standard unification algorithm;
- Consider the following query:

?- $\text{pai}(X) = X$.

- Do these terms unify or not?

?- pai(X) = X.

X=pai(pai(pai(pai(pai(pai(pai(pai(pai(pai(...)))))))))?

;

no

- A standard unification algorithm carries out an **occurs check**:
 - If it is asked to unify a variable with another term it checks whether the variable occurs in this term;
 - In Prolog (ISO standard):

```
?- unify_with_occurs_check(pai(X), X).
```

```
no
```

`vertical(line(point(X,Y), point(X,Z))).`

`horizontal(line(point(X,Y), point(Z,Y))).`

`?- vertical(line(point(1,1),point(1,3))).`

`yes`

`?- vertical(line(point(1,1),point(3,2))).`

`no`

`?-`

vertical(line(point(X,Y), point(X,Z))).

horizontal(line(point(X,Y), point(Z,Y))).

?-horizontal(line(point(1,1),point(1,Y))).

Y = 1;

Yes

?-

Which of the following pairs unify?

1. $\text{pao} = \text{pao}$
2. $\text{'Pao'} = \text{pao}$
3. $\text{'pao'} = \text{pao}$
4. $\text{Pao} = \text{pao}$
5. $\text{pao} = \text{molho}$
6. $\text{comida}(\text{pao}) = \text{pao}$
7. $\text{comida}(\text{pao}) = \text{X}$
8. $\text{comida}(\text{X}) = \text{comida}(\text{pao})$
9. $\text{comida}(\text{pao}, \text{X}) = \text{comida}(\text{Y}, \text{molho})$
10. $\text{comida}(\text{pao}, \text{X}, \text{cerveja}) = \text{comida}(\text{Y}, \text{molho}, \text{X})$
11. $\text{comida}(\text{pao}, \text{X}, \text{cerveja}) = \text{comida}(\text{Y}, \text{big_mac})$
12. $\text{refeicao}(\text{comida}(\text{pao}), \text{bebida}(\text{cerveja})) = \text{refeicao}(\text{X}, \text{Y})$
13. $\text{refeicao}(\text{comida}(\text{pao}), \text{X}) = \text{refeicao}(\text{X}, \text{bebida}(\text{cerveja}))$

Which of the following pairs unify?

1. $\text{pao} = \text{pao}$ **yes**
2. $\text{'Pao'} = \text{pao}$ **No**
3. $\text{'pao'} = \text{pao}$ **Yes**
4. $\text{Pao} = \text{pao}$ **Yes, Pao=pao**
5. $\text{pao} = \text{molho}$ **No**
6. $\text{comida}(\text{pao}) = \text{pao}$ **No**
7. $\text{comida}(\text{pao}) = X$ **Yes, X=comida(pao)**
8. $\text{comida}(X) = \text{comida}(\text{pao})$ **Yes, X=pao**
9. $\text{comida}(\text{pao}, X) = \text{comida}(Y, \text{molho})$ **Yes, X=molho, Y=pao**
10. $\text{comida}(\text{pao}, X, \text{cerveja}) = \text{comida}(Y, \text{molho}, X)$ **No**
11. $\text{comida}(\text{pao}, X, \text{cerveja}) = \text{comida}(Y, \text{big_mac})$ **No**
12. $\text{refeicao}(\text{comida}(\text{pao}), \text{bebida}(\text{cerveja})) = \text{refeicao}(X, Y)$ **Yes, X=comida(pao), Y=bebida(cerveja)**
13. $\text{refeicao}(\text{comida}(\text{pao}), X) = \text{refeicao}(X, \text{bebida}(\text{cerveja}))$ **No**

Which queries are satisfied?

elfo(diogo).

bruxa(herminia).

bruxa('Maria').

bruxa(rita).

magico(X):- elfo(X).

magico(X):- feiticeiro(X).

magico(X):- bruxa(X).

?- magic(elfo).

?- feiticeiro(andre).

?- magico(feiticeiro).

?- magico('Maria').

?- magico(Herminia).

Which queries are satisfied?

elfo(diogo).

bruxa(herminia).

bruxa('Maria').

bruxa(rita).

magico(X):- elfo(X).

magico(X):- feiticeiro(X).

magico(X):- bruxa(X).

?- magico(elfo). **No**

?- feiticeiro(harry). **No**

?- magico(feiticeiro). **No**

?- magico('Maria'). **No**

?- magico(Herminia). **Yes, Herminia = diogo ;**

f(a).

f(b).

g(a).

g(b).

h(b).

k(X):- f(X), g(X), h(X).

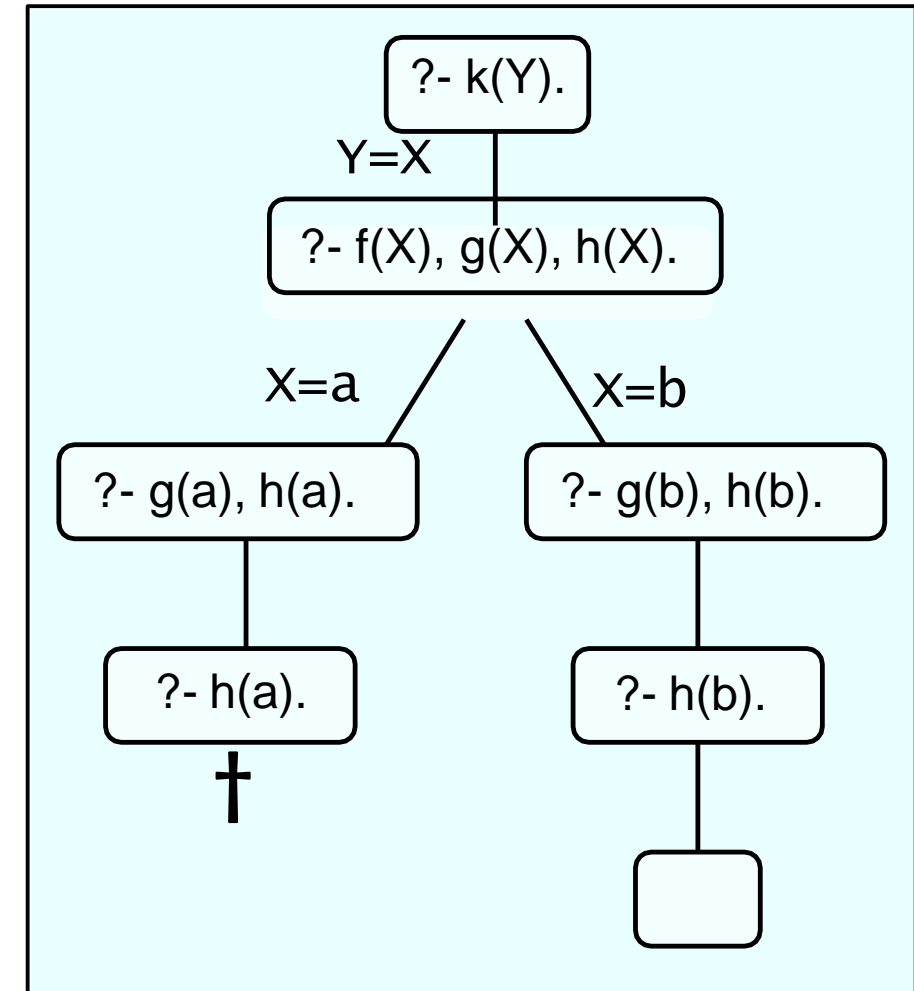

?- k(Y).

Y=b;

true

?-
